

ROCKET*

Unstoppable Growth

ROCKET*

Unstoppable Growth

“Fish” in modern aquaculture undergo many stress causing factors. Rapid growth expectations in a condensed time frame also affect the digestive system of fish. The fish digestive system is rather simplistic, unfamiliar to cope up with these new demands.

Fish like Tilapia, carps & catfish are naturally deficient in digestive enzymes as in nature they are plankton or detritus feeders and are rarely required to digest complex formulated diets. Exogenous Enzymes are now a well-proven and successful tool that helps in complete & proper digestion of feed nutrients in fishes.

ROCKET* is a potent combination of Direct Acting Enzymes. **ROCKET*** makes proteins, fats & starches available to the fish in more simplified formats of amino acids, lipids & sugars respectively, thus easing nutrition uptake. The overall effect is improved feed utilization and a more 'healthy' growth rate.

Benefits:

- **ROCKET*** opens up locked nutritional values in feed.
- Proper utilization of feed reduces wastage.
- Reduces strain on digestive organs
- Increases growth rate
- Reduces FCR
- Shortens grow out time.

Feeding recommendations:

2 gm per Kg of feed for every meal for first 30 days.

4 gm per Kg of feed for every meal for 30 - 60 days.

10 gms per Kg of feed for every meal for 60 days - harvest.

For best results top coat, apply before every feeding meal, shade dry and broadcast. Do not store mixed feed for long. Please consult your Nutritionist for specific dosage. The additive dosage of this product is rather small. Premix it with feedstuff, then add it to the large quantities and mix it evenly.

Can be safely used with other feed premixes like vitamins, minerals etc.
