LACTOJET*

A Scientifically Blended Probiotic Formulation.

Disease control in recent years has undergone a complete change with focus on infection prevention through better nutrition management.

The ban on antibiotics has necessitated the need for better poultry feeding programs.

LactoJet* is a scientifically blended probiotic formulation containing Gram positive *Bacillus* species bacteria. The sporulated probiotic strains start reproducing once inside the gut of the bird. They drive away pathogenic bacteria by lowering gut pH & by competitive exclusion.

In totality, **LactoJet*** makes certain that the G.I. tract flora is well balanced and the feed is properly digested and absorbed. **LactoJet*** ensures that the poultry bird remains healthy and achieves good growth and lower F.C.R.

LactoJet* is especially recommended during & for:

Young animals: Day old chicks are highly susceptible to pathogenic infections. Developing a protective gut microflora is crucial. Administering **LactoJet*** is the key to good growth.

High risk of infections: Disease outbreaks in the area increases susceptibility to illness. Speedy establishment of an optimized unspecific immune system is vital to withstand pathogens **LactoJet*** is the shield of protection.

After antibiotic therapy: Antibiotic therapy severely affects the intestinal microflora of poultry birds. Swift re-establishment of balanced gut micro-flora is the recipe to good growth. **LactoJet*** is the answer

Stress & high mortality: Stress (e.g. feed change, vaccination, heat, crowding, humidity ...) has detrimental effects on the immune system and intestinal epithelium & gut flora, resulting in diarrhoea symptoms. **LactoJet*** provides relief

Feeding recommendations:

Mix 50 gms of **LactoJet*** complex to 1000 kg (One Ton) of feed. Apply at least 2-4 times in week. Please consult your Nutritionist or Veterinarian for specific dosage.

Presentation: Powder, 100 gms sealed pouch
